This is the electronic edition of *Biomolecular Feedback Systems* and is available from <http://www.cds.caltech.edu/~murray/BFS>. Hardcover editions may be purchased from Princeton University Press, <http://press.princeton.edu/titles/10285.html>.

This manuscript is for personal use only and may not be reproduced, in whole or in part, without written consent from the publisher (see <http://press.princeton.edu/permissions.html>).

Contents

Contents	i
Preface	iii
1 Introductory Concepts	1
1.1 Systems Biology: Modeling, Analysis and Role of Feedback	1
1.2 The Cell as a System	8
1.3 Control and Dynamical Systems Tools	11
1.4 Input/Output Modeling	18
1.5 From Systems to Synthetic Biology	22
1.6 Further Reading	27
2 Dynamic Modeling of Core Processes	29
2.1 Modeling Chemical Reactions	29
2.2 Transcription and Translation	44
2.3 Transcriptional Regulation	54
2.4 Post-Transcriptional Regulation	69
2.5 Cellular Subsystems	80
Exercises	86
3 Analysis of Dynamic Behavior	89
3.1 Analysis Near Equilibria	89
3.2 Robustness	102
3.3 Oscillatory Behavior	114
3.4 Bifurcations	123
3.5 Model Reduction Techniques	127
Exercises	133
4 Stochastic Modeling and Analysis	139
4.1 Stochastic Modeling of Biochemical Systems	139
4.2 Simulation of Stochastic Systems	156
4.3 Input/Output Linear Stochastic Systems	159
Exercises	166

5	Biological Circuit Components	171
5.1	Introduction to Biological Circuit Design	171
5.2	Negative Autoregulation	174
5.3	The Toggle Switch	180
5.4	The Repressilator	182
5.5	Activator-Repressor Clock	186
5.6	An Incoherent Feedforward Loop (IFFL)	190
5.7	Bacterial Chemotaxis	193
	Exercises	204
6	Interconnecting Components	207
6.1	Input/Output Modeling and the Modularity Assumption	207
6.2	Introduction to Retroactivity	208
6.3	Retroactivity in Gene Circuits	211
6.4	Retroactivity in Signaling Systems	216
6.5	Insulation Devices: Retroactivity Attenuation	222
6.6	A Case Study on the Use of Insulation Devices	238
	Exercises	241
7	Design Tradeoffs	245
7.1	Competition for Shared Cellular Resources	245
7.2	Estimates of the effects of adding external plasmids on the availability of RNA polymerase ²⁴⁹	249
7.3	Stochastic Effects: Design Tradeoffs in Systems with Large Gains	255
	Exercises	259
A	A Primer on Control Theory	261
A.1	System Modeling	261
A.2	Dynamic Behavior	262
A.3	Linear Systems	264
A.4	Reachability and observability	266
A.5	Transfer Functions	268
A.6	Frequency Domain Analysis	270
A.7	PID Control	272
A.8	Limits of Performance	273
A.9	Robust Performance	274
	Bibliography	277
	Index	284

Preface

This text is intended for researchers interested in the application of feedback and control to biomolecular systems. The material has been designed so that it can be used in parallel with the textbook *Feedback Systems* [1] as part of a course on biomolecular feedback and control systems, or as a standalone reference for readers who have had a basic course in feedback and control theory. The full text for this book, along with additional supplemental material, is available on a companion web site:

<http://www.cds.caltech.edu/~murray/BFS>

The material in this book is intended to be useful to three overlapping audiences: graduate students in biology and bioengineering interested in understanding the role of feedback in natural and engineered biomolecular systems; advanced undergraduates and graduate students in engineering disciplines who are interested the use of feedback in biological circuit design; and established researchers in the biological sciences who want to explore the potential application of principles and tools from control theory to biomolecular systems. We have written the text assuming some familiarity with basic concepts in feedback and control, but have tried to provide insights and specific results as needed, so that the material can be learned in parallel. We also assume some familiarity with cell biology, at the level of a first course for non-majors. The individual chapters in the text indicate the pre-requisites in more detail, most of which are covered either in AM08 or in the supplemental information available from the companion web site.

Acknowledgements. Many colleagues and students provided feedback and advice on the book. We would particularly like to thank Mustafa Khammash, Eric Klavins, and Eduardo Sontag, who gave detailed comments on some of the early versions of the text. In addition, we would like to acknowledge Abdullah Amadeh, Andras Gyorgy, Narmada Herath, Yutaka Hori, Rob Phillips, Phillip Rivera, Vipul Singhal, Anandh Swaminathan, Eric Winfree, and Enoch Yeung for their support and comments along the way. Finally, we would like to thank Caltech, MIT and the University of Michigan for providing the many resources that were necessary to bring this book to fruition.
