

CDS 101/110a: Lecture 6-1 Transfer Functions

Richard M. Murray 3 November 2008

Goals:

- Motivate and define the input/output transfer function of a linear system
- Understand the relationships among frequency response (Bode plot), transfer function, and state-space model
- Introduce block diagram algebra for transfer functions of interconnected systems

Reading:

- Åström and Murray, Feedback Systems, Ch 8
- Advanced: Lewis, Chapters 3-4
- CDS 210: DFT, Chapter 2

Frequency Domain Modeling

Defn. The *frequency response* of a linear system is the relationship between the gain and phase of a sinusoidal input and the corresponding steady state (sinusoidal) output.

Transmission of Exponential Signals

Exponential signal: $e^{st} = e^{(\sigma+i\omega)t} = e^{\sigma t}e^{i\omega t} = e^{\sigma t}(\cos \omega t + i\sin \omega t)$

- Construct constant inputs + sines/cosines by linear combinations
 - Constant: $u(t) = c = ce^{0t}$

- Sinusoid:
$$u(t) = A\sin(\omega t) = \frac{A}{2i}(e^{i\omega t} - e^{-i\omega t})$$

• Exponential response can be computed via the convolution equation

$$\begin{aligned} x(t) &= e^{At} x(0) + \int_0^t e^{A(t-\tau)} B e^{s\tau} \, d\tau \\ &= e^{At} x(0) + e^{At} (sI-A)^{-1} e^{(sI-A)\tau} \Big|_{\tau=0}^t B \\ &= e^{At} x(0) + e^{At} (sI-A)^{-1} \Big(e^{(sI-A)t} - I \Big) B \\ &= e^{At} \Big(x(0) - (sI-A)^{-1} B \Big) + (sI-A)^{-1} B e^{st} \end{aligned}$$

0.5

-0.5

 \geq

$$y(t) = Cx(t) + Du(t)$$

= $Ce^{At} \left(x(0) - (sI - A)^{-1}B \right) + \left(C(sI - A)^{-1}B + D \right) e^{st}$

CDS 101/110, 3 Nov 08

Transfer Function and Frequency Response

Exponential response of a linear state space system

$$y(t) = Ce^{At} \left(x(0) - (sI - A)^{-1}B \right) + \left(C(sI - A)^{-1}B + D \right) e^{st}$$

transient steady state

Transfer function

- Steady state response is proportional to exponential input => look at input/output ratio
- $G(s) = C(sI A)^{-1}B + D$ is the *transfer function* between input and output

Frequency response

Common transfer functions

$$\dot{y} = u \qquad \qquad \frac{1}{s}$$

$$y = \dot{u} \qquad \qquad s$$

$$\dot{y} + ay = u \qquad \qquad \frac{1}{s+a}$$

$$\ddot{y} = u \qquad \qquad \frac{1}{s^2}$$

$$\ddot{y} = u \qquad \qquad \frac{1}{s^2}$$

$$\ddot{y} + 2\zeta \omega_n \dot{y} + \omega_n^2 y = u \qquad \qquad \frac{1}{s^2 + 2\zeta \omega_n s + \omega_n^2}$$

$$y = k_p u + k_d \dot{u} + k_i \int u \qquad \qquad k_p + k_d s + \frac{k_i}{s}$$

$$y(t) = u(t - \tau) \qquad \qquad e^{-\tau s}$$

Richard M. Murray, Caltech CDS

Example: Electrical Circuits

Op amp dynamics: $\frac{v_{\text{out}}}{v} = -\frac{ak}{s+a} =: G(s)$ 10^{6} 10^{2} 10^{2} 10^{0} 10^{0} 10^{0} 10^{0}

Circuit dynamics (Kirchoff's laws):

$$\frac{v_1 - v}{R_1} = \frac{v - v_2}{R_2} \quad \text{and} \quad v_2 = G(s)v$$
$$\frac{v_2}{v_1} = \frac{R_2 G(s)}{R_1 + R_2 + R_1 G(s)} = \frac{R_2 ak}{R_1 ak + (R_1 + R_2)(s + a)}.$$

- Algebraic manipulation can be used as long as we assume exponential signals and all of the components (blocks) are linear
- Transfer function between input and output hows gain-bandwidth tradeoff
- Homework: derive transfer function for a PI controller using an op amp

Transfer Function Properties

Thm. The *transfer function* for a linear system $\Sigma = (A, B, C, D)$ is given by

 $G(s) = C(sI - A)^{-1}B + D \qquad s \in \mathbb{C}$

Thm. The transfer function G(s) corresponding to $\Sigma = (A, B, C, D)$ has the following properties:

- H(s) is a ratio of polynomials n(s)/d(s) where d(s) is the characteristic equation for the matrix A and n(s) has order less than or equal to d(s).
- The steady state frequency response of Σ has gain $|G(j\omega)|$ and phase arg $G(j\omega)$:

 $u = A\sin(\omega t)$ $y = |G(i\omega)|A\sin(\omega t + \arg G(i\omega)) + \text{transients}$

Remarks

- Formally, can show that G(s) is the Laplace transform of the impulse response of Σ
- "y=G(s)u" is formally Y(s)=G(s)U(s) where Y(s) and U(s) are the Laplace transforms of y(t) and u(t). (Multiplication in the Laplace domain corresponds to convolution.)

Richard M. Murray, Caltech CDS

Feedback Interconnection

State space derivation

$$\dot{x} = u = r - ay = -ax + r$$
$$y = x$$

Frequency response $r = A \sin(\omega t)$

$$y = \left| \frac{1}{\sqrt{a^2 + \omega^2}} \right| \sin\left(\omega t - \tan^{-1}\left(\frac{\omega}{a}\right)\right)$$

Transfer function derivation

$$y = \frac{u}{s} = \frac{r - ay}{s}$$
$$y = \frac{r}{s + a} = G(s)r$$

Frequency response

$$y = |G(i\omega)|\sin(\omega t + \angle G(i\omega))$$

Poles and Zeros

$$\dot{x} = Ax + Bu \qquad H(s) = \frac{n(s)}{d(s)}$$
$$y = Cx + Du \qquad d(s) = \det(sI - A)$$

- Roots of *d*(*s*) are called *poles* of *H*(*s*)
- Roots of *n*(*s*) are called *zeros* of *H*(*s*)

9

Poles of H(s) determine the stability of the (closed loop) system

- Denominator of transfer function = characteristic polynomial of state space system
- Provides easy method for computing stability of systems
- Right half plane (RHP) poles (Re > 0) correspond to unstable systems

Zeros of *H*(*s*) related to frequency ranges with limited transmission

- A pure imaginary zero at $s=j\omega_z$ blocks any output at that frequency ($G(j\omega_z) = 0$)
- Zeros provide limits on performance, especially RHP zeros (more on this later)

$$H(s) = k \frac{s^{2} + b_{1}s + b_{2}}{s^{4} + a_{1}s^{3} + a_{2}s^{2} + a_{3}s + a_{4}} \xrightarrow{\text{pzmap}} \underbrace{pzmap}_{\substack{0.6 \\ 0.4 \\ 0.2 \\ 0.4 \\ 0.6 \\ 0.4 \\ 0.6 \\ 0.4 \\ 0.6 \\ 0.4 \\ 0.6 \\ 0.4 \\ 0.6 \\ 0.6 \\ 0.4 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6 \\ 0.6$$

Control Analysis and Design Using Transfer Functions

Transfer functions provide a method for "block diagram algebra"

- Easy to compute transfer functions between various inputs and outputs
 - $H_{er}(s)$ is the transfer function between the reference and the error
 - $H_{ed}(s)$ is the transfer function between the disturbance and the error

Transfer functions provide a method for performance specification

- Since transfer functions provide frequency response directly, it is convenient to work in the "frequency domain"
 - $H_{er}(s)$ should be small in the frequency range 0 to 10 Hz (good tracking)

Block Diagram Algebra

Basic idea: treat transfer functions as multiplication, write down equations

Manipulate equations to compute desired signals

$$e = r - y$$

$$= r - P(s)u$$

$$= r - P(s)(d + C(s)e)$$

$$e = \frac{1}{1 + P(s)C(s)}r - \frac{P(s)}{1 + P(s)C(s)}d$$

$$H_{er}$$
Note: linearity gives superposition of terms

Algebra works because we are working in frequency domain

- Time domain (ODE) representations are not as easy to work with
- Formally, all of this works because of Laplace transforms (see book)

Block Diagram Algebra

Туре	Diagram	Transfer function
Series	$\underbrace{\begin{array}{c} u_1 \\ H_{y_1u_1} \\ u_2 \\ \end{array}} \underbrace{\begin{array}{c} y_1 \\ H_{y_2u_2} \\ H_{y_2u_2} \\ \end{array}} \underbrace{\begin{array}{c} y_2 \\ y_2 \\ H_{y_2u_2} $	$H_{y_2u_1} = H_{y_2u_2}H_{y_1u_1} = \frac{n_1n_2}{d_1d_2}$
Parallel	$u_1 \xrightarrow{H_{y_1u_1}} y_3 \xrightarrow{Y_3}$	$H_{y_3u_1} = H_{y_2u_1} + H_{y_1u_1} = \frac{n_1d_2 + n_2d_1}{d_1d_2}$
Feedback	$\begin{array}{c} r \\ \hline \Sigma \\ \hline U_1 \\ \hline H_{y_1u_1} \\ \hline H_{y_2u_2} \\ \hline U_2 \hline U_2 \\ \hline$	$H_{y_1r} = \frac{H_{y_1u_1}}{1 + H_{y_1u_1}H_{y_2u_2}} = \frac{n_1d_2}{n_1n_2 + d_1d_2}$

- These are the basic manipulations needed; some others are possible
- Formally, could work all of this out using the original ODEs (\Rightarrow nothing *really* new)

MATLAB manipulation of transfer functions

Creating transfer functions

- [num, den] = ss2tf(A, B, C, D)
- sys = tf(num, den)
- num, den = $[1 a b] \rightarrow s^2 + as + b$

Interconnecting blocks

• sys= series(sys1, sys2), parallel, feedback

Computing poles and zeros

- pole(sys), zero(sys)
- pzmap(sys)

I/O response

step(sys), bode(sys)

Example: Engine Control of a GM Astro

$$H_{\theta_{l}T_{e}}(s) = \frac{Kr}{J_{e}J_{l}s^{3} + J_{e}B_{l}s^{2} + (J_{e}K + KJ_{l})s + KB_{l}}$$

Richard M. Murray, Caltech CDS
